HACKATHON SUBMISSION

Volume 1 — Operator Manual

For operators and end users: setup, daily workflows, and operating practice

Team: TraversalAI

Members: Ahmad Alfaqeih, Mustafa Maisara

Coach: Ms. Amal Qutairi

Project Identity and Scope 3

Judging Criteria Alignment 3

Setup and First Run 4

Daily Operations 4

Operational Safety 5

Operator Reference Map 5

SECTION

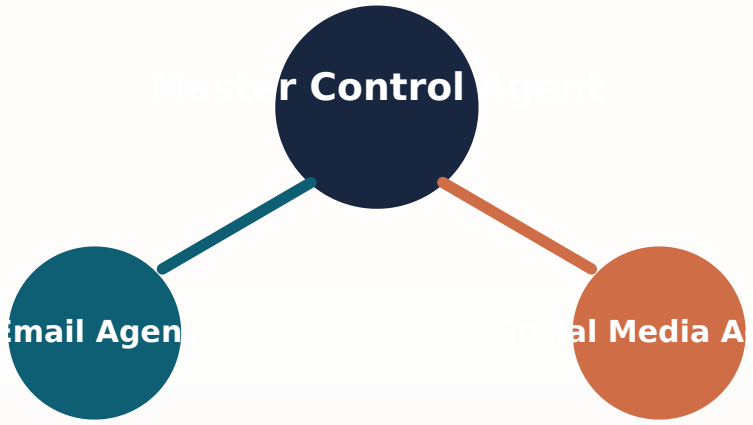
Project Identity and Scope

This manual presents TraversalAI as a hackathon-ready intelligent operations platform under team TraversalAI, built by Ahmad Alfaqeih, Mustafa Maisara, coached by Ms. Amal Qutairi.

- Built-in agents are provisioned automatically during first-run setup.
- The standalone chat UI routes through the gateway only.
- Primary runtime targets are Raspberry Pi 5 and compatible Node environments.

Built-in Agent Orchestration

The main agent coordinates the email and social media specialists



SECTION

Judging Criteria Alignment

This volume emphasizes live operation, presentation quality, impact, and interview readiness.

- Design: make the problem, flow, and component boundaries easy to understand.
- Innovation: show the multi-agent, tools, and skills model as one coherent solution.
- Electronics: anchor the system to Raspberry Pi 5 with real input/output hardware.
- Programming: demonstrate the gateway, sessions, and model orchestration as implemented code.
- Presentation and communication: support a short, clear live narrative for judges.
- Impact: connect the solution to a real tourism or hospitality problem with a working prototype.

SECTION

Setup and First Run

Install the application, then run onboarding to prepare agents, workspaces, session stores, and gateway credentials.

```
npm install -g traversalai@latest
traversalai onboard --install-daemon
traversalai chat --no-open
```

- Master Control Agent: coordination, delegation, and session oversight.
- Email Agent: inbox tasks, drafting, and organization.
- Social Media Agent: posting, monitoring, and engagement.

SECTION

Daily Operations

In daily use, operators interact through the chat UI or CLI commands to send tasks, switch models, switch agents, and revisit saved sessions.

- Use saved chats to resume prior work instead of restarting context.
- Switch agents by task domain rather than mixing unrelated work in one session.
- Review tool activity before trusting an automated execution result.

End-to-End Flow

From user message through routing, agent execution, tools, and final response

SECTION

Operational Safety

The platform is personal-by-default, not a hostile multi-tenant boundary. Tighten controls when more than one user can reach the same tool-enabled surface.

- Use allowlists and pairing before enabling remote access.
- Keep specialized agents on least-privilege tool profiles.
- Run health and security audit checks regularly.
